

Case study 427

University event needs cooling

As the UK's leading provider of climate control equipment for hire, Andrews Air Conditioning has both the necessary resources and expertise to handle enquiries on any scale. Having worked on countless projects for schools and local authorities, we are frequently relied upon to deliver cooling systems at short notice. Whether our clients seek a single unit or an all-encompassing package for a large application, we will accommodate your requirements quicker than any of our competitors.

So when one of Wales' leading universities sought temporary air conditioning for a series of graduation ceremonies, we acted quickly to ensure their requirement was accommodated. Large people congregating inside a relatively small space had caused the area to feel uncomfortable for guests, and this was compounded by outdoor temperatures exceeding the mid-twenties. The client was looking for some portable units to operate alongside their fixed cooling system, which had proved slightly inadequate on its own.

The enquiry was processed quickly via our contact centre which negated the need for an independent site survey. Once the dimensions of the building had been established, we were able to propose a workable solution based on the information given. Three Cyclone Evaporative Coolers were subsequently delivered and installed within a short time of our technician arriving on the premises.

These were selected because of their suitability to environments where outdoor access is limited, such as the university's main hall. The Cyclone model is able to generate large volumes of localised comfort cooling and represents an effective alternative to exhaust tube and split type units. Their deployment therefore allowed guests to remain comfortable throughout each sitting, much to the satisfaction of the customer.

Power supply 220/240 V 1 ph 50 Hz
Weight 70 kg Full 25 kg Empty
Dimension 600 x 530 x 550 mm
Average power consumption 300 W/hr
Reservoir capacity 45 litres
Water consumption 10 ltr/hr (approx)
Air delivery 2,550 m³
